West Virginia Emission Inventory Development

EPA's redesignation guidance requires the submittal of a comprehensive inventory of $PM_{2.5}$ precursor emissions (SO_2 NO_x and primary particles – organic carbon, crustal matter, and elemental carbon) representative of the year when the area achieves attainment of the annual $PM_{2.5}$ air quality standard. States must also demonstrate that the improvement in air quality between the year that violations occurred and the year that attainment was achieved is based on permanent and enforceable emission reductions. Other emission inventory related requirements include a projection of the emission inventory to a year at least 10 years following redesignation; a demonstration that the projected level of emissions is sufficient to maintain the 1997 $PM_{2.5}$ standard; and a commitment to provide future updates of the inventory to enable tracking of emission levels during the 10-year maintenance period.

The base year, attainment year and projection years emissions inventory development discussion below identifies procedures used by the Division of Air Quality (DAQ) to develop emissions estimates for West Virginia's portion of the counties in the Parkersburg-Marietta area. Emissions data are provided for all West Virginia counties as well as those in Ohio.

Ohio base year and projections emissions data were obtained from Ohio EPA (OEPA) and developed by the Lake Michigan Air Directors Consortium (LADCO). LADCO is an multi-jurisdictional organization (MJO) which provides technical support to Ohio and the other Lake Michigan states.

Onroad mobile base year and projections emissions inventories for all West Virginia and Ohio counties were developed by the Ohio Department of Transportation (ODOT), Division of Transportation System Development-Modeling and Forecasting Section, using the air quality analyses and underlying planning assumptions agreed upon through interagency consultation among ODOT, OEPA, EPA, DEP, WVDOT (West Virginia Department of Transportation) and the Wood-Washington-Wirt Interstate Planning Commission (WWW).

A. 2005 and 2008 Emissions Inventories

Periodic inventories, which include emissions from all sectors - Mobile, Area, Nonroad, and Point sources - are prepared every three years. For the purpose of this submittal the 2005 periodic inventory is used as the nonattainment base year, and the 2008 periodic inventory is used as the attainment base year.

Emissions of $PM_{2.5}$, SO_2 and NO_x for 2005 and 2008 are summarized in Table 8, as well as Tables 10-24.

1. <u>Area Source Inventories</u>

   EPA's redesignation guidance requires agencies to provide emissions inventories to demonstrate that improvements in air quality are the result of decreases in the quantity of pollutants released to the air. Therefore, the inventories for the years of concern must be comparable. However, there were significant differences between the source categories contained in the 2005 and 2008 Area Source NEIs. Harmonizing and reconciling the two

datasets required considerable effort but were necessary to serve as a basis for emissions projections.

The DAQ has traditionally relied upon EPA to prepare the Area Source inventory. In past years EPA contractors have prepared national inventories using top-down methodologies. Such was the case for the 2005 Area Source NEI. EPA'S 2008 inventory was prepared using methodologies developed in collaboration with the Eastern Regional Technical Advisory Committee (ERTAC). ERTAC is a joint EPA, State and local agency effort to get agreement on emission factors and methodologies. As a result the methodologies used to develop the inventories differed. Indeed, when 2005 and 2008 emissions were compared there were often huge differences between pollutant emissions values for identical categories.

Point source subtraction added another variable to meaningful comparisons of emissions estimates for the two years. EPA was unable to prepare a complete 2008 NEI due to time and resource constraints and requested state and local agencies to perform point source subtraction for several general categories of source classification codes (SCCs). The DAQ complied but it is not certain that the methods employed were identical.

Additionally there was another group of SCCs that EPA did not develop emission estimates for at all. As a first step to harmonize the 2005 and 2008 NEI Area Source data, lists of SCCs used in the two inventories were compared. There were about 15 SCCs contained in the 2005 Area Source NEI that did not appear in the 2008. There was only 1 SCC in the 2008 NEI that did not appear in the 2005 inventory. Therefore, emissions associated with each of the SCCs contained in the 2005 NEI were carried forward and the those in the 2008 NEI associated with the single SCC were carried back.

Industrial combustion of wood, SCC 2102008000, appeared in the 2005 NEI for Cabell, Kanawha, Putnam, Wayne, and Wood Counties but did not appear in the 2008 inventory. SO_2 emissions values were about 60 times higher than for NO_x or $PM_{2.5}$. This SO_2 value is unreasonably high and it appears that EPA caught the error and did not include it in the 2008 inventory. Therefore, those records associated with SCC 2102008000 were removed from the 2005 dataset.

Commercial marine vessels (CMVs) and locomotives were contained in the 2008 v1.5 Area Source file. SCCs 2280002100, 2280002200, 2285002006, and 2285002007 were moved from the Area Source dataset to the Nonroad CMV locomotive dataset. Historically, many locomotive- and rail- associated SCCs have appeared in the Area Source inventory. The 2005 and 2008 datasets were checked for their presence but none were found, therefore, no reconciliation was required. Aircraft- and airport-associated emissions have also been contained in the Area Source inventory. Both datasets were checked for SCCs 2501080050 and 2501080100, as well as SCCs 2275085000 through 2275900202, which are associated with the Area Source inventory, but none were found. Other aircraft emissions SCCs were contained in the Nonroad and point inventories and are discussed in those sections.

EPA used similar but different SCCs for another group of SCCs, residential wood combustion. For example, in the 2005 NEI residential wood combustion, fireplaces, general were associated with SCC 2104008001 while in the 2008 NEI those emissions were

associated with SCC 2104008100. Furthermore, emissions values were about double for each pollutant than in 2005, which is an implausible difference. This disparity of emissions shown between the years for residential wood combustion was observed throughout this group of SCCs. Since the emissions values were so different no effort was made to reconcile the differences as this was beyond the scope of this effort; therefore, no changes were made.

Area Source inventories for 2005 and 2008 were based on the 2005 National Emissions Inventory (NEI) version 2 and 2008 NEI version 1.5. The 2005 data for West Virginia were downloaded from http://www.epa.gov/ttn/chief/net/ 2005inventory.html#inventorydata; the file name was "SCC Summaries Nonpoint 05 Version 2." The 2008 Area Source file was downloaded from http://www.epa.gov/ttn/ chief/net/2008inventory.html; the file name was "2008v1_5 GPR NP."

2. Biogenic Source Inventories

Biogenic emissions are not included in these summaries.

3. Nonroad Mobile Source Inventories

Nonroad mobile source inventories were developed by DAQ personnel using monthly NONROAD Model runs for 2005 and 2008, and summing the monthly data to obtain annual data.

Historically marine (CMV), air, and rail/locomotive (MAR) Nonroad inventories have been calculated outside of the NONROAD Model. As in the Area Source inventory discussion above, MAR SCCs were not allocated consistently among the inventory sectors in the 2005 and 2008 NEIs. NEI MAR 2005 emissions were included in the Nonroad sector data while they were contained Area Source sector data in the 2008 NEI.

In the 2008 NEI airport/aircraft emissions were moved to the Point source sector. Consequently SCCs 2265008005, 2267008005, 2268008005, 2270008005, 2275050011, 2275050012 and 2275070000 were removed for this demonstration from the 2005 MAR Nonroad file and appended to the 2005 Point inventory for consistency with the 2008 Point NEI.

The remaining 2005 and 2008 CMV and locomotive/rail data, consisting of SCCs 2280002100, 2280002200, 2285002006, and 2285002007 were then compared. Although the number of records differed slightly the emissions totals by pollutant seemed reasonable so no further reconciliation efforts were attempted.

The 2005 CMV and locomotive/rail inventories were contained in the dataset named "SCC Summaries Nonroad 05 Version 2 - 2" and downloaded from "ftp://ftp.epa.gov/ EmisInventory/2005_nei/mobile_sector/scc_summaries." The 2008 Nonroad source file was downloaded from http://www.epa.gov/ttn/chief/net/ 2008inventory.html; the file name was "2008v1_5 GPR NP."

4. Onroad Mobile Source Inventories

Onroad mobile source emissions for 2005 and 2008 were calculated from MOVES2010 - produced emission factors. See Appendix C.

5. Point Source Inventories

The 2005 and 2008 Point Source data are taken from West Virginia's annual emissions reporting program and subsequently submitted to the NEI. EGU NO_x and SO_2 emissions data came from EPA's Clean Air Markets Division (CAMD) database at http://camddataandmaps.epa.gov/ gdm/index.cfm?fuseaction=emissions.wizard, while $PM_{2.5}$ emissions were based on data reported directly to the West Virginia DAQ.

To support its Cross-State Air Pollution Rule (CSAPR) development EPA used its Integrated Planning Model (IPM) to project future year 2014, 2020, and 2030 emissions inventories. The DAQ used the CSAPR projections for the point EGU sector for its future year projections as well. CSAPR EGU data came from EPA's Emissions Modeling Clearinghouse at http://www.epa.gov/ttn/chief/emch/index.html#final. CSAPR projections were based on the 2005 NEI but for their IPM runs they removed many SCCs normally associated with SIC 4911 (NAICS 22111) from the EGU dataset to the nonEGU dataset. Specifically the CSAPR IPM data did not contain space heating, materials handling fugitives, or cooling tower emissions. The following SCCs associated with SIC 4911 facilities were contained in the 2005 nonipm file:

10500106, 10500205, 30501008, 30501009, 30501010, 30501011, 30501012, 30501014, 30501039, 30501040, 30501043, 30501047, 30501050, 30501090, 30502005, 30510103, 30510105, 30510199, 30510205, 30510299, 30510303, 30510305, 30510405, 30510499, 30510503, 30510505, 30510599, 30588801, 38500101, 38500102

The 2008 NEI point source dataset had to be separated into EGU and nonEGU parts for consistency with the CSAPR projections. The DAQ then had to ensure that SCCs were distributed consistently between the EGU and nonEGU parts of the inventory in the 2005 and 2008 datasets. Therefore, in the DAQ's 2008 inventory those SCCs had to be moved from the EGU dataset to the nonEGU Point source dataset.

When 2005 and 2008 EGU Point source $PM_{2.5}$ emissions were compared it became apparent that although the quantities of fuel burned at the Process level of the inventories were within expected ranges, the $PM_{2.5}$ emissions values were unreasonably low. SO_2 and NO_X emission values were consistent with throughputs.

The emissions inventory software used by the DAQ, *i*-STEPS is legacy software based on EPA's AIRS Facility Subsystem (AFS), which in turn derived from the older National Emissions Data System (NEDS) system and as a consequence contains many pollutant codes - particularly codes associated with particulate matter (PM) - that are no longer supported by EPA's new Emissions Inventory System (EIS). The DAQ has only required reporting by

industry of filterable PM and has not enforced consistent reporting condensible PM. Until the 2008 NEI, EPA would accept reporting filterable and have their contractors augment the data using nationally consistent methodologies.

With the 2008 NEI, however EPA indicated it would no longer accept incomplete PM submittals and required state agencies to perform PM augmentation themselves. Having no experience with PM augmentation, the DAQ requested and received technical support from EPA staff who authorized their contractor to provide guidance. Although the technical support was quite useful, some minor misapplication of one of the algorithms may explain the major differences in $PM_{2.5}$ emissions in the data DAQ submitted to the 2008 NEI. In September, 2011 the DAQ provided new staging tables to EPA. EPA in turn has agreed to augment the resubmitted PM filterable values using the same contractor and methodology it has in the past. Revisions should appear in version 2.0 of the 2008 NEI.

For the purposes of this request, however, since the 2008 NEI v2.0 is not yet available at the time of this writing, a method had to be found to make 2005 and 2008 PM emissions comparable. Review of EPA's CSAPR technical support document (TSD), "*Emissions Inventory Final Rule TSD*, June 28, 2011" provided the answer. "For CEMS units with pollutants not covered by CEMS (e.g., VOC, $PM_{2.5}$, HCl) unit-specific ratios of 2005 to 2002 heat input were applied to 2002v3 emissions to obtain 2005 estimates." This method was used to calculate 2008 $PM_{2.5}$ primary emissions on a unit by unit basis based on the 2005 NEI data, on which EPA had performed the PM augmentation.

There were more airport/aircraft/aviation SCCs in the 2008 NEI v1.5 Point inventory than in the 2005 v2. The 2005 NEI includes 2275001000 and 2275020000 only, while the 2008 v1.5 NEI includes 2265008005, 2267008005, 2268008005, 2270008005, 2275070000, 2275050011, and 2275050012 as well as 2275001000, 2275020000. Therefore, the 2008 NEI emissions associated with SCCs 2265008005, 2267008005, 2268008005, 2270008005, 2275050011, 2275050012 and 2275070000 were appended to the 2005 Point inventory.

B. 2015 and 2022 Emissions Projection Inventories

DAQ prepared a comprehensive inventory for the West Virginia portion of the Wheeling, WV-OH area including Area, Mobile, and Point sources for $PM_{2.5}$, SO_2 and NO_x for future years 2015 and 2022.

1. Area Source Inventories

Area Source inventories for 2015 and 2022 were developed by DAQ based on the 2008 inventory using Workforce West Virginia economic forecasts (http://www.workforcewv.org/LMI/indproj/longterm/WV.htm). The inventory for 2008 was

taken from the 2008 NEI v1.5. The DAQ had three options to serve as a basis for future year emissions: the U.S. Bureau of Labor Statistics, The West Virginia University Bureau of Business Research (BBR), and the WV Department of Commerce, Workforce West Virginia. The Workforce WV projections were selected because their projections are based on more local data and over the BBR because the categories were covered at a higher level of resolution, covered a wider range of years and were based on 2008, which dove-tailed nicely with the inventory base year.

Workforce WV projections were in terms of North American Industrial Classification System (NAICS) codes while the WV 2008 v1.5 Area Source data is in terms of SCCs. A list of SCCs contained in the 2008 WV Area Source inventory was compiled and the associated with each NAICS code for which there was a Workforce WV growth factor. Then directly proportional growth factors were calculated and applied to Workforce WV's 2018 growth factor to calculate 2015 and 2022 emissions. The final estimates reflect both positive and negative growth.

2. Biogenic Source Inventories

Biogenic emissions are not included in these summaries.

3. Nonroad Mobile Source Inventories

a. NONROAD Model Inventories
Nonroad mobile source inventories were developed by DAQ personnel using monthly NONROAD Model runs for 2015 and 2022, and summing the monthly data to obtain annual data.

b. Locomotive and Marine Inventories
Locomotive and Marine inventories for 2015 and 2022 were developed by DAQ personnel based on the 2008 inventory using Workforce West Virginia economic forecasts. The same methods as were used to project emissions as described in the Area Source discussion above were applied to the Nonroad Locomotive and Marine inventories.

4. Onroad Mobile Source Inventories

Onroad mobile source emissions for 2015, and 2022 were calculated from MOVES2010 - produced emission factors. See Appendix C.

5. Point Source Inventories

a. EGU Emissions

Point Source - EGU emissions were compiled from EPA's CSAPR inventories for 2015, and for 2022 were interpolated between EPA's 2020 and 2030 CSAPR inventories.

b. NonEGU Emissions

Point Source - NonEGU inventories for 2015 and 2022 were grown from the 2008 inventory using Workforce West Virginia economic forecasts. The methods used to perform the growth were the same as those for the Area and Nonroad Locomotive and Marine inventories.

Table updated on Oct 28,
For monthly and annual means, thresholds, and sums:
Months with 5 or more missing days are not considered
Years with 1 or more missing months are not considered
Seasons are climatological not calendar seasons
Winter = Dec., Jan., and Feb. Spring = Mar., Apr., and May
Summer = Jun., Jul., and Aug. Fall = Sep., Oct., and Nov.
