

## Descriptors for Growth Habits

**Arching:** Growth is similar to the “spreading” form but cane tips bend back towards the ground.

**Climbing:** When tied or supported will climb indefinitely. If not supported, these plants take on a wide arching habit.

**Dense:** Many upright canes create an erect dense plant habit.

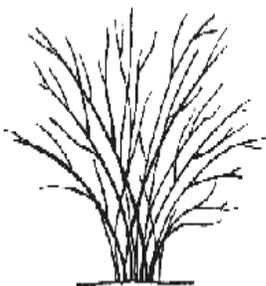

**Groundcover:** Canes grow horizontally over the ground’s surface.

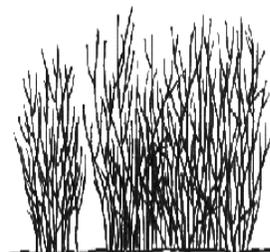

**Open:** Upright canes create an erect plant similar to the “dense” form, except that the number of canes is fewer; resulting is an open, airier habit.

**Rugosa:** This form is typified by frequent branching of canes and short internodes.

**Spreading:** These plants are V-shaped. Cane growth is angled instead of vertical.

**Suckering:** This is similar to the “dense” form except that suckering can occur. Unless controlled, suckering can increase plant width.
