Extec S-5 Portable Screening Unit Process Description

The purpose of this Application for General Permit Registration is to set up a portable rock screening unit to screen crushed rock from the roadway excavation of the Coalfields Expressway, in Raleigh County, West Virginia. This processed rock will be used on the project as subgrade and or backfill for paving activities.

The portable screening unit will receive its' power to operate from an electric generator, powered by a Duetz BF4M2012 Engine, Tier 4 Final, Stage IV Technology. The Duetz BF4M2012 Engine is designed to meet exhaust regulation EU-RL 97/68 (Step 2) and US-EPA Nonroad (Tier 2) standards.

The process will begin with a wheel loader transferring the crushed rock from the surge pile to the portable screen receiving hopper. A water truck will provide dust suppression for the haul road and surge pile. The receiving hopper feeds the rock onto the screen. The material will go from the screen onto the two side conveyors and tail conveyor. A factory installed water spray bar will provide dust suppression for the main product conveyor. The screened rock will go from the conveyors to the stockpiles. A water truck will provide dust suppression for the stockpiles. The screened rock will be stockpiled and utilized as needed.

Attachment C:
Portable Screening Unit Description of Fugitive Emissions

The sources and potential sources of fugitive particulate emissions are as follows:

- Surge Pile
- Loadout from Surge Pile
- Receiving Hopper
- Double Deck Screen
- Hopper Belt
- Main Conveyor
- Tail Conveyor
- Side Conveyor
- Dumping from Conveyors to Stockpiles
- Stockpiles
- Loadout From Stockpiles

The primary fugitive dust control equipment will be a 2,000 gallon water truck. The water truck will be used primarily to control fugitive particulate emissions on the haul roads, and stock piles. By wetting the material in the surge pile and stock piles, fugitive particulate emissions will also be controlled at the receiving hopper, double deck screen and conveyors by moisture carry over. The water truck has a maximum application rate of approximately 150 gallons per hour and the application frequency will depend on environmental conditions. The frequency will vary from zero during rainy conditions to approximately four to five applications per day during extremely dry conditions. In addition to the water truck, a factory installed spray bar on the main product conveyor will also be used. This spray system has a maximum application rate of approximately 26 gallons per hour. Again the frequency rate will vary depending upon environmental conditions. The spray bar will be used continuously during operation.

1.8 Measured Noise Level

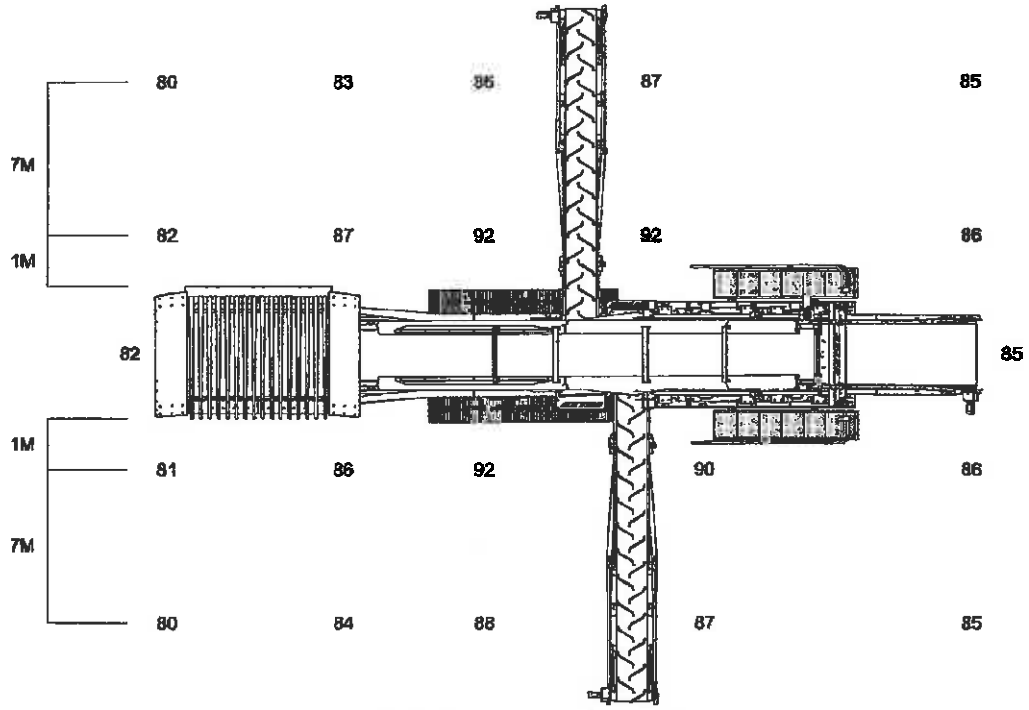

Figure 1-1: Measured Noise Level

The above diagram indicates the measured noise levels at a measured distance.

i.e. 7 m - 85 dB indicates at 7 meters the sound recorded was 85 decibels. The readings were measured using a Castle GA101/701 meter with a calibration date of 05/06/04 and with all systems running situated on the factory assembly line.

The product and local conditions will affect the noise levels.

Ear protection is compulsory within 10 meters of the machine when the engine and all other parts of the machine are running.

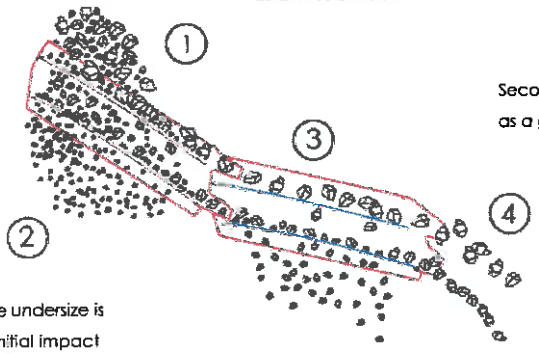
S-5 Doublescreen box

- The doublescreen facility consists of two individual screening units, each having its own separate drive and each independently angled.

First screen box is used as a fines extractor



Second Box operates as a grader.

Clean Gradings at very high output are produced as material is exposed to a very large screening area

The majority of the undersize is removed during initial impact

Max angle 2nd screen box	27°
Mesh size	1397mm (Width) x 1981mm (Length) 4' 6" (Width) x 6' 4" (Length)

Doublescreen Box features and benefits

Screen Boxes can be set hydraulically at different angles for each screen box	Fine materials can be separated much more efficiently as the first box can remove most of the fine materials leaving the second box to act as a grader
Separate drive motors enable a reverse throw of materials.	Further increases in efficiency and greater separation of fine materials Increased force against the flow of materials enabling greater effectiveness
Reduced area needed to house the screen boxes	Many structural benefits can be gained with much reduced size for the amount of productivity. Strength can be increased and rigidity of the frame is better Better vibration can also be gained through the smaller screening area
Separate variable speed motors for each screen box	An extremely accurate screening of materials can be achieved through the individual set up of each box to produce the most precise specification.

Double deck vibrating grid

Opening between grid flares	3169mm	(10' 4")
Grid bar opening	101mm x 127mm	(3" x 5")
